These requirements are for member parts that are connected by a joining process such as welding or brazing that produces heat that can induce a lack of stability or strength in the member. This standard applies to members made of plain carbon or alloy steel, which is a type of ferritic steel. It also applies to members made of other types of steel such as stainless steel. 0102 - Composites This standard provides requirements for the design, fabrication, and testing of composite structures, including, but not limited to, composite components, structures, and assemblies. It applies to those composite structures made from material that is not governed by this standard and to those structures containing composite members that are bonded by a process other than lamination. When composite components and assemblies are bonded by a process that induces a lack of stability or strength in the member, the performance of the bonded structure must be evaluated for weaknesses induced by the bonding process. For bonded structures, this standard applies to all composite members that have been bonded together. In bonded structures, composite members are not limited to composite materials. The standards of this paragraph do not apply to composite

laminates, which are layers of composite material bonded together and have a laminate thickness of more than 3.2 millimeters (12.0 millimeters for laminated composites). 1. Scope 1.1 This standard covers the requirements for design, fabrication, and testing of composite structures, which include, but are not limited to, the design, fabrication, and testing of members, subassemblies, structures, and assemblies. This standard applies to those composite structures made from material that is not governed by this standard and to those structures containing composite members that are bonded by a process other than lamination. 1.2 When composite components and assemblies are bonded by a process that induces a lack of stability or strength in the member, the performance of the bonded structure must be evaluated for weaknesses induced by the bonding process. 1.3 This standard does not apply to bonded structures that use composites. Composite laminates, which are layers of composite material bonded together and have a laminate thickness of more than 3.2 millimeters (12.0 millimeters for laminated composites), are not covered by this standard. 1.4 This standard does not cover composite laminates. 1.5 This standard does not cover composite laminates. 1.6 This standard does not cover bonded structures that use composites 82157476af
